# FINOLEX CPVC PIPES & FITTINGS

Finolex CPVC Pipes are our premium range of pipes for hot and cold water applications. Manufactured with the latest technology and using high grade raw material, the CPVC pipes can withstand higher temperatures as compared to many other plastic piping systems.

We recommend the use of our CPVC pipes for water supply and distribution in both domestic and industrial applications, and for solar and electric water heaters.

Finolex CPVC pipes are lightweight, non-corrosive and long lasting, which makes them a good substitute for GI and conventional pipes. These pipes are manufactured using lead free compounds. Hence they are safe, and health and environment friendly. Our stringent quality assurance approach across all stages of manufacturing gives this product a high degree of reliability, making it a preferred choice of leading MEP Consultants, architects, builders, plumbing contractors, plumbers, and quality conscious people.

CPVC plumbing pipes are available in sizes ranging from 15mm (1/2") to 50mm (2"), which conforms to IS 15778 in SDR 11 and 13.5 classes in 'Copper Tube Size' (CTS). These pipes are also available in 'Iron Pipe Size' (IPS) ranging from 65mm (2 1/2") to 150mm (6") in Schedule 40 and Schedule 80 series, which meet the requirements of ASTM F 441. Finolex CPVC pipes are plain ended and are available in standard lengths of 3 and 5 meters with various pressure ratings.

Although these pipes have similar physical properties, the classes differ in wall thickness and therefore at any given temperature their pressure ratings will differ. Finolex CPVC pipes are recommended for water temperature up to 82°C. CPVC fittings are available in sizes from 15 mm (1/2") to 50 mm (2") and meet the requirement of ASTM D 2846 in Copper Tube Sizing (CTS). CPVC fittings from 65 mm (2.1/2") to 150 mm (6") in Schedule 40 and Schedule 80 are manufactured as per ASTM F 438 & ASTM F 439 respectively.

## PRECAUTIONS

- Brush must be clean and dry before commencing the solvent welding process.
- System should be pressure tested before concealment.
- Do not attempt cementing in rain or in moist conditions.
- Cement should be used within the expiry period mentioned on the container.
- Use of primer prior to the solvent cement joint is essential for pipe sizes 65mm (2 1/2") and above. This will increase the joint strength.
- Keep cement away from all sources of ignition, heat, spark, and open flame.
- Keep cement containers tightly closed after use.
- Store solvent cements and pipe component in a cool area.

## INSTALLATION OF CPVC PIPES WITH SOLAR WATER HEATERS

- CPVC SDR 11 pipes are recommended for use with solar water heaters in the main line.
- Based on the height of the building, it is necessary to provide expansion and contraction loops in case of exposed pipes used in solar water heater installations.
- It is strongly recommended that solar water heaters must be installed with thermo-regulating valves. However, if thermo-regulating valves are unavailable, air-venting on the hot water outlet side must be provided.
- Only brass transition fittings must be used for all connections with solar water heaters.
- Ensure that proper pipe clamp support is provided.
- When used with gas water heaters, CPVC pipes and fittings should not be directly connected to the heater. At least 150mm (6") clearance from the flame is recommended. For the initial portion a long metal nipple or GI pipes must be used.
- Finolex CPVC pipes can be directly connected to the electrical water heater with special metal-to-CPVC transition fittings.
- Don't thread, groove, or drill CPVC pipes.
